Liaised with representatives and staff of local underfunded schools to organize lessons.

PROJECTS

Solari | GitHub

A job portal where recruiters can post job applications, and volunteers can filter postings by various metrics such as location, interests, etc.
The backend is written in Java, with the front-end being written using the JavaFX Framework. User and recruiter information and job postings are stored on a SQL database.

Tracker 50 | GitHub

An online flight tracking interface that allows users to search up the status of any flight.
The backend is written in Python, with HTML/CSS/JavaScript used to create the frontend. Usernames and passwords are stored on a SQL database. The website is built using the Flaks framework in conjunction with Jinja2, and flight information is provided by the AviationStack REST API.

(TA)sker | GitHub

A course logistic management system to be used by faculty/administrative staff to create new courses or manage ongoing ones.
The backend is written in Java, with the front-end being written using the Java Swing GUI framework.
Created schedules are stored as JSON files, and can be transferred to other instances of the application.
